

**IN THE SPECIFICATION:**

**Please revise the paragraph on Page 4, Line 19 as follows:**

--At steps 60 and 62, data structures are created for the pre-written filter and for the specifically written filters. As represented by step 64, the specifically written filters are matched with the pre-written filters. When a match for a specifically written filter is found, the routine, as represented by step 66, creates a data structures for the matched pre-written filter; and when no match is found for a specifically written filter, the routine, as represented by step 70, creates a data structure entry with the specific filter. Steps 64, 66 and 70 are repeated until searches have been performed to find matches ~~to~~ to all the specifically written filters. Then, at step 72, a new specific filter file is written, and at step 74, the pre-written filter file and the new specific filter file are loaded onto the router.--
